

ETHERNET FIRST MILE

COST EFFECTIVE COPPER ETHERNET SERVICES

Empowering business connections throughout the UK

Ethernet First Mile (EFM) utilises multiple copper pairs with the ability to supply bandwidth up to 10Mbps in both directions. Its an ideal solution if you're not quite ready to make the investment for fibre services.

How is Ethernet First Mile delivered?

Fusion delivers EFM in 5 variants, 2, 4, 6, 8 & 10Mb. The available speed at your location will depend on copper quality and distance from the exchange. If you already have a SDSL service, it's likely you can achieve 5 times the speed using EFM.

If your company potentially needs access to higher bandwidth you should consider fibre services which are capable of delivering 10Gb.

EFM delivery over existing copper is up to 30working days and is less likely to incur excess charges as copper is readily available.

Features:

- Guaranteed speed
- Equal upload & download
- Scope up to 10Mb
- Built-in resilience
- Enhanced care SLA
- Fast provision
