

ETHERNET

SCALEABLE, RAW BANDWIDTH

Empowering business connections throughout the UK

Fibre services are the world's most reliable, scalable and future-proof method of connecting offices (point to point) and providing Direct Internet Access (DIA), offering speeds from 2Mbps to 1Gbps; it's the connectivity choice of enterprise users, but now within reach of smaller organisations due to an increasingly competitive wholesale pricing structure.

How is Ethernet delivered?

Fusion delivers fibre in two variants, which determine the maximum capacity of 100Mb or 1Gb, and they're both presented in the form of RJ45 connecting straight into your existing infrastructure.

So, after the initial setup investment, your company will have access to guaranteed bandwidth up to the maximum capacity. This is ideal for growing businesses, as we can supply the bandwidth you need now (anything from 2Mb), and easily upgrade when you need to (up to the full 100Mb or 1Gb).

Fusion works with a number of wholesalers accessing the fibre already laid, providing the most cost effective delivery method, with services typically live within 65 working days.

How is Ethernet different to other technologies?

It isn't delivered over copper, which provides a range of benefits:

- Guaranteed speed
- More bandwidth
- Low latency
- Huge scope
- Highly reliable
- Industry leading SLAs
